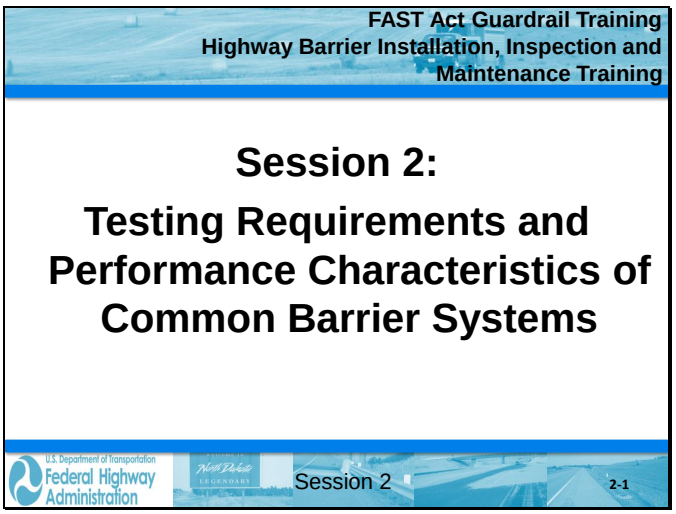
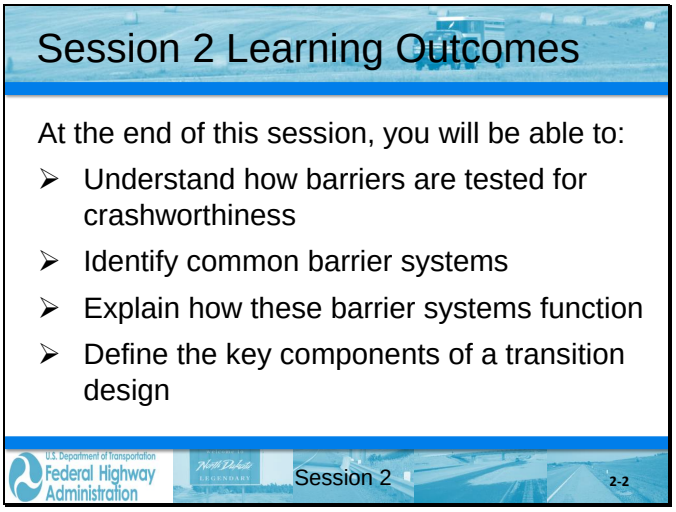
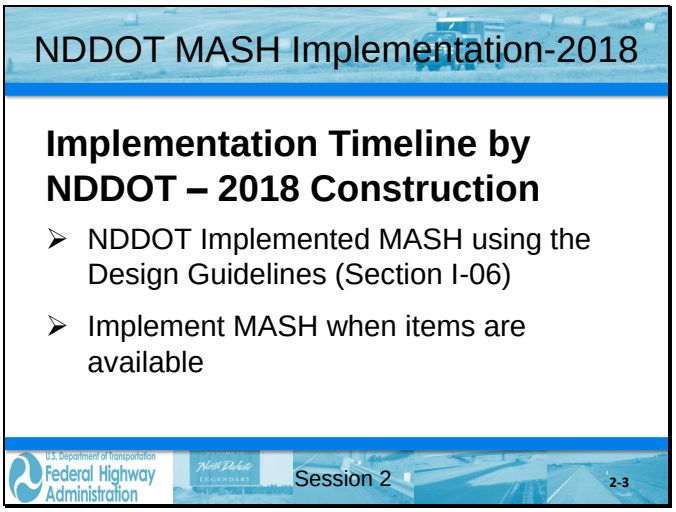
Session 2: Testing Requirements and Performance Characteristics of Common Barrier Systems



FAST Act Guardrail Training
Highway Barrier Installation, Inspection and Maintenance Training
Session 2:
Testing Requirements and Performance Characteristics of Common Barrier Systems
U.S. Department of Transportation
Federal Highway Administration
Session 2
2-1



Session 2 Learning Outcomes
At the end of this session, you will be able to:
Understand how barriers are tested for crashworthiness
Identify common barrier systems
Explain how these barrier systems function
Define the key components of a transition design
U.S. Department of Transportation
Federal Highway Administration
Session 2
2-2



NDDOT MASH Implementation-2018

NDDOT Implemented MASH using the Design Guidelines (Section I-06)

- Minor Rehab & Structural Improvement
  - Changed minimum from NCHRP Report 230 to NCHRP Report 350
  - Upgrade to MASH if not in conformity to NCHRP Report 350
- Major Rehab & New/Reconstruction
  - Changed minimum from NCHRP Report 350 to MASH
- If safety hardware is not available for MASH performance criteria, use NCHRP Report 350 minimum.

U.S. Department of Transportation Federal Highway Administration | Session 2 | 2-4

MASH Test Conditions

Selection of a performance level is based on speed and traffic mix.

- **TL-1**, **TL-2**, and **TL-3**: crash tests with small car and pickup truck with a 25˚ impact angle at 31, 44, and 62 mph, respectively.

Session 2

2-8

Functional Requirement of Barrier

- Structural adequacy of the tested feature
  - *Contain vehicle with no penetration, under-ride or over-ride of the installation*
- Occupant risk
  - *Test vehicles (car and pickup) must remain upright* (75 deg max rotation)
  - *No penetration or significant deformation of the passenger compartment*
  - *Tolerable passenger impact velocities (40 ft/sec max) and deceleration (20G's max)*

Session 2
2-10

Barrier Systems: Rigid Barriers

Rigid Barrier Systems have little (between 0 to 1 ft.) deflection under the TL-3 pickup impact. They are generally anchored by some acceptable means.

Examples include:

- New Jersey Safety Shape Concrete Barrier
- F-shape Concrete Barrier
- Single or Constant Slope Concrete Barrier
- Vertical Wall

Barrier Systems: Semi-Rigid

Semi-Rigid Barrier Systems have deflections of a few feet (between 2 to 5 ft.) under the TL-3 pickup impact.

Typically consist of beam and post elements.

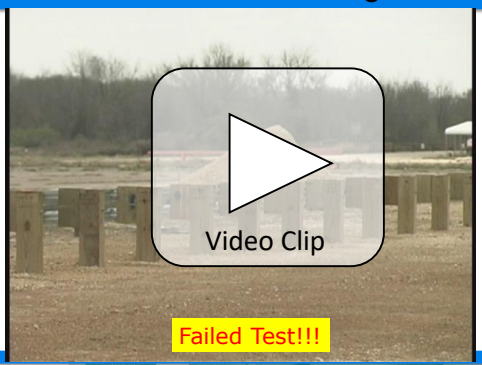
Barrier Systems: Semi-Rigid

- W-Beam Guardrail – **PREVIOUS STANDARD (G4 28")**
  - 12" wide W-beam rail section (12-gauge thickness).
  - Posts are spaced at 6'-3" centers
  - Nominal rail height is 28".

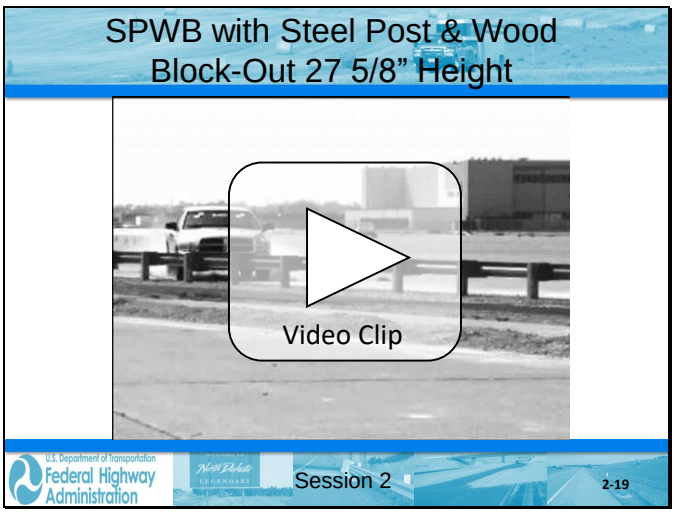
  (Installation tolerance - ¼" ; + 1")
  - Rail splice at the post.
  - Wood posts: 6" x 8" x 6'-0" long.
  - Block-outs: 6" x 8" wood.

U.S. Department of Transportation Federal Highway Administration — Session 2 — 2-17

SPWB with Wood Post & Wood Block-Out 27 5/8" Height



U.S. Department of Transportation Federal Highway Administration — Session 2 — 2-18



Guardrail Height for Existing 28"(G4)

W-Beam guardrail that is less than 26 ½ inches high <u>after an overlay</u> should be raised, reset, or reconstructed.

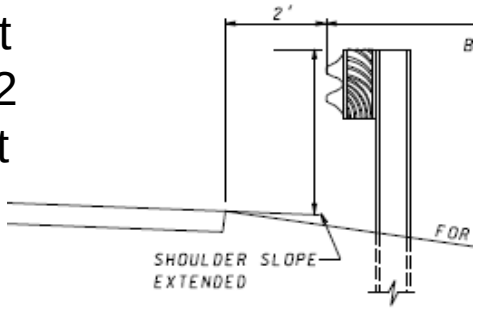
While new installations must be at least 27 ¾ inches high, this guidance recognizes that it is not cost effective to raise an existing barrier if it is slightly lower.

G4 Guardrail - Height Measurement

For slopes 10:1 or flatter, the height is measured from the ground directly beneath the rail

For slopes steeper than 10:1 but no steeper than 6:1, and within 2 feet of the breakpoint, the height is measured from the shoulder slope extended as shown

Only for the G4 Guardrail



PLACEMENT ON SLOPE

Barrier Systems: Semi-Rigid

- Midwest Guardrail System (MGS)
  - 31” Height – Tolerance ±1”
  - Rail Splice mid-span.
  - Post spacing 6’-3”
  - Wood posts: 6” x 8” x 6’ long
  - Block-out: 8” deep wood

STANDARD MGS GUARDRAIL SYSTEM

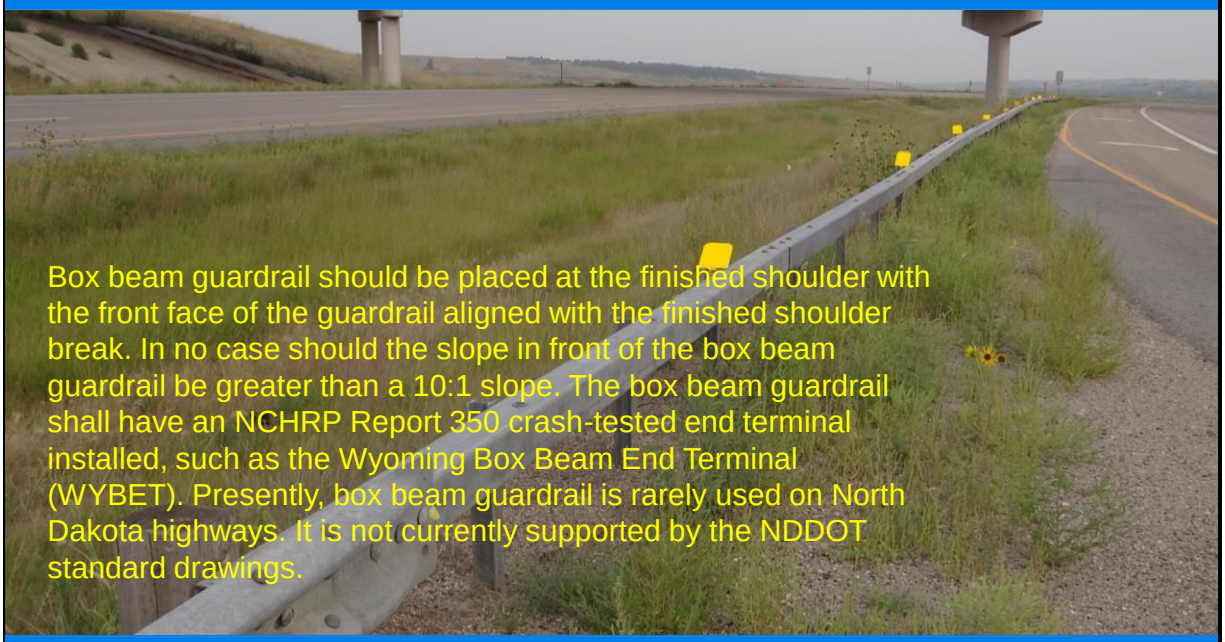
Ref: NDDOT Standard Drawing, D-764-40, July 2017

Guardrail Height for MGS

- The installation tolerance for the 31 inch MGS is +1 inch/ - 1 inch.
- After an overlay the minimum height should be 28 inches.

U.S. Department of Transportation Federal Highway Administration
Session 2
2-27

Existing ND Box Beam



Box beam guardrail should be placed at the finished shoulder with the front face of the guardrail aligned with the finished shoulder break. In no case should the slope in front of the box beam guardrail be greater than a 10:1 slope. The box beam guardrail shall have an NCHRP Report 350 crash-tested end terminal installed, such as the Wyoming Box Beam End Terminal (WYBET). Presently, box beam guardrail is rarely used on North Dakota highways. It is not currently supported by the NDDOT standard drawings.

U.S. Department of Transportation Federal Highway Administration
Session 2
2-28

Barrier Systems: Flexible Barriers

Flexible Barrier Systems typically have relatively large deflections

Examples of Flexible Barriers include:

- Weak post W-beam
- Low tension cable
- High tension cable

Barrier Systems: Flexible Barriers

Advantages of cable systems include:

- Low initial cost
- Lower deceleration forces
- Effective vehicle containment and redirection
- Installation conditions

ND Three Cable Low Tension System

_____

_____

Barrier Systems: Flexible Barriers

For new installations, North Dakota generally uses High Tension Cable Guardrail.

High Tensioned Cable Guardrail

- Five different proprietary designs available
- Each requires a unique proprietary terminal
- Advantages over low tension:
  - Somewhat reduced deflections
  - Generally easier maintenance
  - Can retain effectiveness after most impacts

Median Barriers

- Used to separate opposing traffic on a divided highway or to separate through traffic from local traffic.
- Many barriers approved for roadside applications can be modified for use in the median. They can be rigid, semi-rigid and flexible barriers.
- Width of the median is an important consideration.
- Also must consider the dynamic deflection of the barrier to avoid intrusion into opposing traffic.
- There are terminals designed specifically to shield the ends of median barriers.

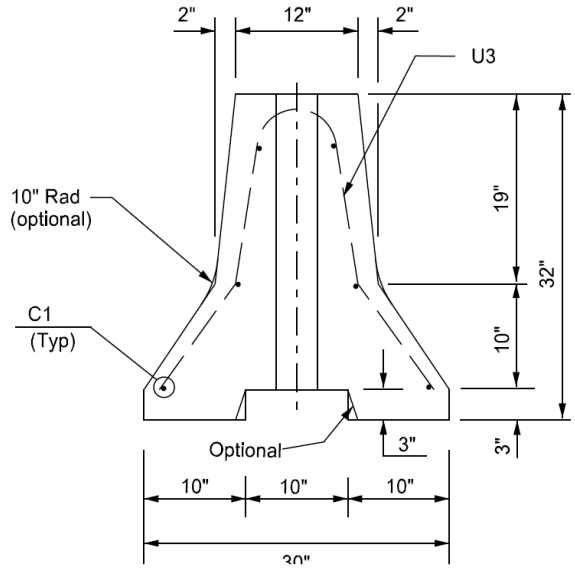
Work Zone Concrete Barriers

Portable reinforced concrete safety shape barrier

Dynamic deflection of the barrier is an important consideration in choosing a work zone barrier.

Work Zone Barrier Performance

NDDOT NJ-Shape- Temporary



Ref: NDDOT Standard Drawing, D-704-51, 09/27/2017

Work Zone Concrete Barriers

- Temporary Concrete barrier generally used for vertical drop-off, to shield work area and separating two way traffic.

Note: NDDOT Standard Temporary Barrier is same as GA temporary barrier and with 10 ft. segments deflection was 76 inches.

Work Zone Concrete Barriers

The following criteria should be considered when portable concrete barriers are needed to be deployed at restricted sites:

- All sections are to be adequately connected to adjacent sections.
- The end section should be anchored to prevent overturning and excessive sliding.
- Adequate clearance should be provided between the barrier and the work area to allow for sliding of the barrier. If adequate clearance is not available, the barrier should be anchored.

Ref: AASHTO ROADSIDE DESIGN GUIDE, 4th EDITION, Chapter 9.2.1.2.17

Work Zone Concrete Barriers

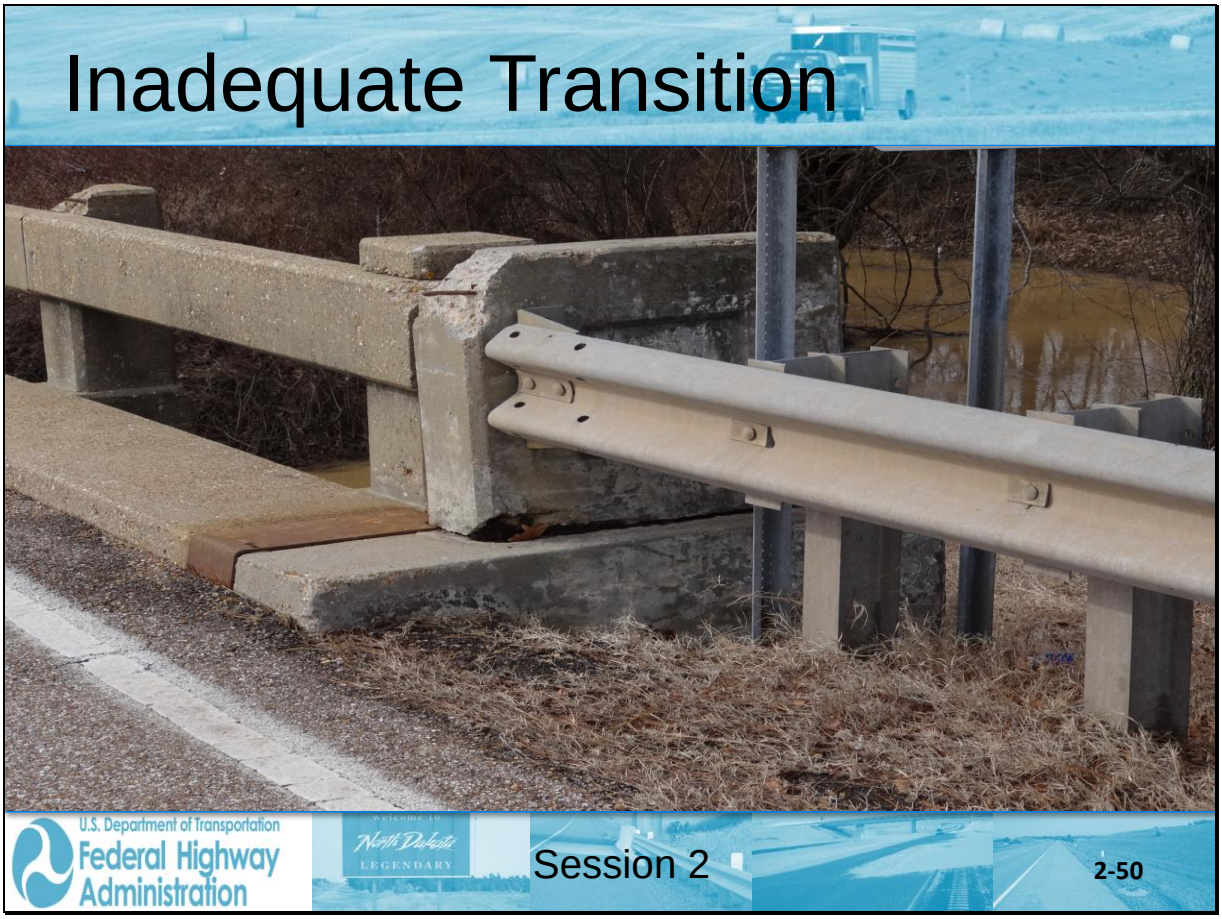
The following criteria should be considered when portable concrete barriers are needed to be deployed at restricted sites: (cont'd)

- Precautions should be taken to prevent the barrier from caving into an excavation (or dropping off edge of structure).
- 2 ft. offset desirable.
- Flare rates of 4:1 – 8:1. (Consider speed and potential angle of impact.)

Ref: AASHTO ROADSIDE DESIGN GUIDE, 4th EDITION, Chapter 9.2.1.2.17 & 9.2.1.2

Transition Sections

- When a softer (more flexible) barrier precedes a stiffer barrier, a gradual stiffening must occur between the two systems.
- An effective transitions must provide the following:
  - Adequate connection (TENSION continuity)
  - Adequate length to gradually increase stiffness.



Inadequate Transition

Federal Highway Administration
Session 2
2-51

Transition Sections

Successfully crash-tested transitions include the following essential elements (in addition to a structural connection):

- Additional and/or Larger Posts
- Nested rail (w-beam or Thrie-beam)
- Prevention of Snagging (such as Curbs {only as crash-tested transition unit}, Rub Rails, Flared Parapet Wall)

MGS Transition

MGS Transition Design
